

Google Search Console Implementation & Indexing Analysis

DebRelSa Tech Consulting – Real-World Business Implementation

Overview

This project documents the implementation and validation of Google Search Console for a live business website.

The objective was to verify domain ownership, submit a sitemap, monitor indexing status, validate page accessibility, and analyze early search performance. All activities were conducted within a real production environment, reflecting practical SEO monitoring and search visibility workflows.

Phase 1 — Property Setup & Verification

A domain property was added in Google Search Console to enable full-site monitoring.

Domain ownership was verified using DNS-based TXT record validation within Squarespace.

During the process, an additional unused verification token was generated. The existing TXT record successfully confirmed ownership, and no further action was required.

Result:

- Domain successfully verified
- Full access to indexing and performance data enabled

Custom records for your domain.

ADD RECORD

TYPE ?	NAME ?	PRIORITY ?	TTL ?	DATA ?
TXT	@	N/A	4 hrs	google-site-verification=s47U8nzKX38EJUY...

Phase 2 — Sitemap Submission

The website sitemap was submitted through Google Search Console to support page discovery and indexing.

All pages within the sitemap were successfully processed and made available for search engine crawling.

Result:

- Sitemap successfully submitted

- All site pages discovered by Google

Figure 3: Sitemap successfully submitted

Phase 3 — Indexing Validation

Indexed Pages Review

Google Search Console confirms that the website's primary pages—including the homepage, services, contact, and about pages—have been successfully indexed.

These pages represent the core structure of the business website and are typically prioritized by search engines due to their relevance and importance.

Crawl data indicates recent activity, confirming that Google is actively accessing and evaluating the site.

Indexing Analysis

Google Search Console identified several non-indexed URLs, primarily related to redirect handling, canonical URL selection, and a confirmation page.

Redirect-related entries (HTTP to HTTPS and non-www to www) were reviewed and confirmed to be functioning correctly, ensuring a consistent and secure URL structure.

Canonicalization settings were also validated, with alternate versions properly pointing to preferred URLs.

One page was identified as "discovered but not indexed," corresponding to a confirmation (thank-you) page. This page is intentionally hidden from search engines, as it is not intended for public discovery.

Result:

- Core pages successfully indexed
- No critical indexing errors identified
- URL structure and canonical handling confirmed

Figure 6: List of Pages NOT Indexed

Why pages aren't indexed				
Pages that aren't indexed can't be served on Google				
Reason	Source	Validation	Trend	Pages
Redirect error	Website	Not Started		2
Alternate page with proper canonical tag	Website	Not Started		2
Page with redirect	Website	Not Started		1
Discovered - currently not indexed	Google systems	Not Started		1
Blocked due to unauthorized request (401)	Website	N/A		0

Phase 4 — URL Inspection

URL inspection was performed on key website pages using Google Search Console to validate indexing status and accessibility.

Primary pages were successfully indexed and confirmed to be accessible to Google, with no restrictions preventing crawling or indexing.

URL inspection is used selectively for validation and is only repeated when new pages are created or significant updates are made.

Result:

- All key pages validated as indexable
- No crawl or indexing restrictions identified

Figure 7: URL Inspection Results

Phase 5 — Performance Monitoring

Search Performance Analysis

Google Search Console data indicates that the website has begun appearing in search results, generating 5 clicks and 9 impressions.

Performance metrics show a high click-through rate (55.6%) and strong average position (1.3), primarily driven by branded search queries.

The homepage demonstrated the strongest performance, achieving a 100% click-through rate and top ranking position.

Additional pages, including services, about, and contact, have begun appearing in search results but have not yet generated clicks.

Query-level data is not yet available due to low search volume, which is expected during early indexing stages.

Traffic is currently limited to the United States, aligning with the business’s target region, and is distributed across both mobile and desktop devices.

Analysis

These findings indicate that the website has successfully entered the initial visibility phase.

Search engines have begun indexing and testing the site in search results, with strong early performance for branded queries and gradual exposure for additional pages.

Figure 8: Performance Monitoring Results

Conclusion

The Google Search Console implementation was successfully completed, enabling full visibility into indexing status and search performance.

Core website pages have been indexed, sitemap submission was successful, and no technical barriers to indexing were identified.

Early performance data confirms that the website is appearing in search results and generating initial traffic, primarily through branded queries.

The website is now positioned for growth in search visibility. Future improvements will be driven by content expansion, local SEO efforts, and increased user engagement.

Key Takeaways

- Domain ownership successfully verified using DNS validation
- Sitemap submission enabled full site discovery
- Core pages indexed with no critical errors
- URL structure and canonical handling validated
- Early search performance established with strong branded visibility
- Website successfully transitioned from setup phase to visibility phase
